Failure	Where	What it did	What would catch it
Source families over-merged	H5, H7, H12, H13 (Fig. 3d)	the transitive closure chains 233 of 553 books into one family; with transcription links only, the four would rest on two or three families, but H5 and H13 rest on copies of one Jingui clause each, so one family is right for them	judge independence per claim, from the passages that support it, not per book
Co-listing read as association	R1; H8	R1: 口熱 and 上氣 are two items of the kidney channel's list of illnesses, which later books copy; H8: 小腹痛 belongs to the 尺脈伏 sentence, which gives 大平胃丸, not to 腎气丸	require the relation to be stated (indication, cause), not co-mention, before a lost or restated link counts
Concept drift on loose evidence	H2–H4	the evidence includes passages that do not name 中风 (迎風, 風氣百疾) and one Shanghan lun clause (傷寒中風) in four witnesses; the drifts' own permutation tests fail (P = 0.66, 0.89, 0.98), yet narrowing to 'exploratory' closes the objection and all three reach the expert	take drift evidence only from passages naming the term, copies once; make a failed test of the hypothesis's own statistic a hard objection
Case records read as doctrine	H9–H11	the 内科摘要 sentence and the 外科精要 passage are Xue Ji's records of treatments that failed (不應; 愈甚), not views; the 外科精要 and 校注妇人良方 witnesses are Xue Ji's editions (1547), whose notes and cases take the dates of the base texts (1263, 1248), so H9 sets Xue Ji against himself	read case records as records of practice; date editors' notes and cases as a later layer
Overlapping hypotheses	H2–H4; H9–H11	three drifts share the four witnesses of one clause, and three contradictions share one 内科摘要 passage	group hypotheses whose evidence overlaps before they are reviewed
Coverage of the open corpus	sources dossier	the open corpus keeps 8 of 24 chapters of 小儿药证直诀 (1119), none with 地黄丸, so the earliest composition of 六味地黄丸 found is of 1564; the 地黄丸 of 978–992 is another formula of the same name	state the sampled share beside every earliest attestation; rerun on the full store

Also reported, not repaired: the two unsafe readings of the held-out interpretive cases (Fig. 4c) and the open-corpus benchmark, too small to separate the ranking from chance (its replication of Fig. 5).
